WINTERING BEES.

Packing Colonies In Straw In an Open Storm Shed.

At the back side of the bee building at the Montana experiment station and running the length of it is a room with a dirt floor fitted up with two skeleton shelves of 2 by 4 so that some forty or fifty colonies of bees may be win tered under as nearly normal conditions as possible, with the entrances connected with the outside, permitting the bees to fly at will.

Above these rooms in the gable roof is ample storage room for empty hives and for surplus combs when not in use for the honey harvest.

During the first two winters prior te the erection of this bee house expert

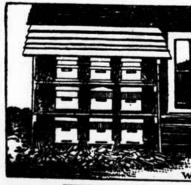

SHELTER POR BERRIVES.

ments were carried on in outdoor wintering and in packing a number of colonies in straw under one roof. The experiments during the last two years were not only modified by the indoor wintering with packing only above the colonies, but also by packing colonies in straw in an open shed against the side of the house. (See the accompanying figures.)

Outdoor wintering is usually accomplished in chaff hives, and one great objection is the expensiveness of these hives. Otherwise, since it is the most normal condition for bees, this method is to be recommended for inexperienced beekeepers. The feature of these chaff hives is a double wall with from three to eight inches of space between the walls on all sides, including the bottom, filled with some nonconductor of heat like straw, chaff, paper or ground cork. The effect of this packing is to retain the heat and at the same time permit the moisture produced by the bees to pass off.

To further permit moisture to escape the oil or carriage cloth quilt used in summer is removed and a canvas quilt placed over the frames. Above this newspapers, a piece of old quilting or a chaff tray may be used to retain the heat. Then above this material to retain the heat there should be an open space with free ventilation, accomplished by auger holes through the ga ble ends of the roof. The roof and whole hive should be thoroughly paint-ed and the hive placed several inches off the ground to prevent freezing and thawing and the attendant soaking up of water. The entrance formed by a bridge passageway through the packing at the usual place is contracted to

HIVES IN PLACE

[Ready for a winter protection of board and straw to be put across the front.] an inch or so for the winter. There should be in most instances no trouble in wintering bees so packed if they are strong in numbers and with plenty of stores,-Montana Experimental Sta-

Dried Leaves Useful. Plenty of dried leaves should be gathered for bedding and to bank up cellars and pits, suggests Americas Cultivator. Bog hay is also good for this purpose. In some localities large areas of brook hay and bog hay have this year not been considered worth cutting for stock, but now that work is not so pressing some farmers could find time to cut this grass for bedding and mulch. Simply mow it, leave it for a day or two, then turn the swaths, and next day it will be cured well

enough for these purposes. Bell Weevil Problems.

All students of the problem of boll weevil control have agreed that in the prevention of successful hibernation lies the most effectual means of reducing the numbers of the weevil and preventing injury the next season. Two methods are advocated—first, the de-struction of the stalks in the fail as or the cotton crop, planting on land in cotton the previous year and as ar from such land as is possible.—E.

OUTDOOR EVAPORATOR.

Handy Arrangement For Drying Fruit In Small Quantities.

Portable evaporators are especially convenient when it is desired to dry only a few bushels of fruit at any one time. The usual sizes have a capacity of five to ten bushels a day, and even more in some cases, although the quantity will of course vary with the attention given to them. As they are complete in themselves and are not too heavy to be readily moved they may be placed wherever convenience from time to time dictates.

The figure shows an evaporator of this type which is constructed entirely

PORTABLE EVAPORATO'L

of wood, except the parts in direct contact with the heater. There is space for ten trays for holding fruit, the di mensions of which are 21/2 by 3 feet Each tray holds about one-half bushed of fruit Modifications of such au equipment to suit individual needs and conveniences readily suggest themselves.

There are several other styles of this type obtainable from manufacturers which are made of sheet from usually galvanized. As no wood enters into their construction danger from fire is eliminated. One of these styles is provided with a heat deflector and so constructed that hot currents of air pass over the fruit as well as up through it, the claim being made that this movement of air induces a more rapid drying of the fruit than in ordinary methods of construction.-H. P.

Denatured Alcohol.

The manufacture of denatured alcohol is engrossing the attention of farmers everywhere in the United States. However, the development of the industry since the favorable legislation by congress last year has been bindered by the apparent inability of farmers to immediately put the business on an economical and practical basis, says New England Homestead It will naturally take some little time to work out this problem. A brief refereace to conditions in France, where the industry is a practical success, will prove lastructive.

It is claimed on the continent that alcohol can be made more profitably from sugar beets than from potatoes At least this has proved so in France. Farmers there, however, say that the distillation of beets ceases to be profitable when the price of alcohol falls below 25 cents per gallon. In Germany great quantities of potatoes are distilled, largely by the small farmer. yet in many instances these are favored by a premium or bonn cial character which helps make production profitable. In France the farm er aims to do his distilling after crops are harvested, when he has some slack time on his hands.

When We Were All Teners.

The primitive inhabitants of Europ were all tenors. Their descendants of the present time are baritones, and future generations will have semibass voices. The voice has a tendency to deepen with age. The tenor of twenty omes the baritone of twenty-eight and the bass of thirty-six. The inferior races have higher pitched voices than the more cultured. The negro has a higher voice than the white man. Among white races the fair complexioned man has a higher voice than his darker skinned brother. The former is usually a baritone or a tenor, the latter a contraito or bass. It is asserted that tenors are usually of slender build, whereas basses are stout, but there are too many exceptions to such a rule for it to be reliable. The same remark applies to the statement that thoughtful men have deep toned voices. and vice versa. The tones of a voice are perceptibly higher before than after a meal, for which reason tenors are nerally careful not to sing too soon after dinner.-Pearson's Weekly.

Maiden Insur

The Maiden Insurance company is singular Denmark institution. It is confined to the nobility, and the noble man, as soon as a female child is born to him, enrolls her name on the com-pany's books and pays in a certain sum and thereafter a fixed annual amount to the treasury. When the young girl has reached the age of young girl has reached the age of twenty-one she is entitled to a fixed income and to an elegant suit of apartments, and this income and this residence, both almost princely, are hers until she either marries or dies. The society has existed for generations. It has always prospered. Thanks to it, poverty stricken old maids are unknown among the Denmark nobility.

DR. KING'S

FOR COUGHS AND COLDS. FOR WEAK, SORE LUNGS, ASTHMA, BRONCHITIS, HEMORRHAGES

> AND ALL THROAT AND LUNG DISEASES.

PREVENTS PNEUMONIA

I regard Dr. King's Hew Discovery as the grandest medicine of medern times. One bottle completely cured me of a very bad cough, which was steadily growing worse under other treatments. EARL SHAMBURG, Codell, Kas.
