

INCENSE OF FLOWERS.
This rich abundance of the rose, its breath,
On which I almost think my soul could live:
This sweet ambrosia, which even in death
Its leaves hold on to give—
Whence is it? From dank earth or scented air?
Or from the inner sanctuaries of heaven?
We probe the branch, the root—no incense there—
O God, whence is it given?
The essence of the morning dew,
Or distillation of a purer sphere—
The breath of the immortals coming through
To us mortals here?
Exquisite mystery, my heart knows
The living inspiration, and I know
Sweet revelations with the breath of flowers
Into our beings flow.
ROBERT LEIGHTON.

British Agricultural Statistics.

The agricultural returns for Great Britain for the current year have just been published, and show the following result in acres, as compared with the three previous years:

1872.	1873.	1874.	1875.
Wheat.....3,598,957	3,490,380	3,630,300	3,432,388
Barley.....2,316,332	2,335,913	2,287,087	2,569,508
Oats.....2,705,837	2,676,227	2,596,364	2,664,048
Potatoes.....564,088	514,682	520,428	522,634
Hops.....61,927	63,278	65,805	79,203

The area of wheat is, therefore, about 290,000 acres less than last year, a reduction of nearly 8 per cent. Barley shows an increase, somewhat larger in proportion than the decrease in wheat, though not as large in area. The number of animals, June 25th, in each year, is as follows:

1872.	1873.	1874.	1875.
Cattle.....5,624,994	5,964,549	6,125,491	6,012,605
Sheep.....27,921,567	29,427,635	30,313,941	29,165,278
Pigs.....2,771,749	2,500,289	2,422,832	2,229,870

While the population of Great Britain increases from year to year, it will be seen by the above figures that there are fewer sheep to furnish mutton in 1875 than there were in 1874 by 1,448,663. This is a large reduction for one year, and fully explains the steady high price of mutton in all British markets. These facts are encouraging to sheep husbandry in the United States, and especially to the long wool, or Cotswold breed, as combing wool sells twice as high now as twenty years ago.

Hogs, always called pigs in England, have diminished nearly 200,000 since last year. Good fat porkers and bacon are likely to rule high for the next six or eight months, for the cholera, the scarcity of grain last season and other causes, have materially reduced the price of swine, especially in the west and southwest.

Fruit Tree Planting.
Have farmers thought the time for planting orchards has arrived? Have they set apart a few more acres of ground to be planted in fruit trees to furnish fruit for themselves, and their stock? Have they considered the fact that a few acres in a good orchard will frequently bring larger returns than all of the rest of the farm?
The ground should now be got ready for plowing. Let it be rolling ground, if possible, to carry off the surplus water. The higher the ground the better it is for fruit, as it is frequently saved from destruction by spring frosts, if on an elevated piece of ground. Plow the ground deeply now, and about the first of November cross plow it. Fat the land in the best condition for the trees. Lay it off carefully so all the rows will be straight and not be an eyesore to every passer-by. Dig holes about four feet square by two feet deep, and when the tree is planted, fill in enough surface soil so the roots will stand no deeper than when in the nursery. Select good varieties, such as you know are adapted to your locality, and plant the trees with care. After planting, the newspaper or brown paper or some kind around each tree to the height of a foot and a half from the ground to prevent the rabbits from eating the bark.

Raise corn, or potatoes, or beans, or cabbage, or tobacco, or some hoed crop, in the orchard for the first few years, and you will soon have an abundance of fruit, and will be well paid for all the expense and care bestowed in securing you a good orchard.—*Coburn's Rural.*

An Awful Brute.
Yesterday afternoon, a young lady dressed in the narrow gauge style, had occasion to cross Lake Avenue where there is no crosswalk. She had just alighted from a car on the opposite side of the street from her home. Near her paternal residence two men were standing engaged in conversation. On the side of the street there was quite a puddle of water or rather quite a stream, as it was flowing down the avenue in good style. This young lady must necessarily cross. Managing her diminutive skirts as best she was able she then cast an eye over the situation. She thought she could step over it, but alas for human calculations, she made an error in the distance, or in the supposed extent of her skirts, or something, for she lifted up her delicate foot and planted it directly in the center of the dirty pool. In her dismay she dropped a parcel she had in her arms, and while trying to pick it up, in some unaccountable manner she lost her balance and sat down plump in the water and mud. One of the gentlemen at once ran to her assistance and helped her within the gate, bundle and all. The other man was unable to restrain his risibles and burst into a hearty laugh, wrong as such proceeding certainly was. The young lady's face needed no rouge as she turned round, thanked her benefactor, and casting a withering look on the other chap and giggling, "You're a big brute," scamped into the house.

The Science of Storms.
Prof. Tice of St. Louis, has given a brief explanation of the theories upon which he works in forecasting the state of the weather upon certain dates in the future, which are here copied:
Electricity is the cause of all atmospheric movements.
The primary atmospheric movements are: 1. A down-pour of air from the surface of the atmosphere upon the earth, and 2. an up-pour of air from the surface of the earth toward the zenith.
Under the down-pour there is high barometer, and under the up-pour there is a low barometer.

All currents of air on the surface of the earth flow from an area covered by a high barometer, into an area covered by a low barometer. All currents in the upper regions of the atmosphere flow from the top of the up-pouring column

over an area of high barometer into the vortex of a down-pouring column over an area of a low barometer.
The down-pouring column is called the anticyclonic vortex; the up-pouring column the cyclonic vortex.
Over and around the cyclonic vortex clouds are always formed, and in it rain, hail and snowstorms are generated, together with their attendant phenomena, such as tornadoes, hurricanes, etc.
No clouds are formed over, but clear or clearing weather prevails within and around the anticyclonic vortex, consequently no storms of any character are generated within it, though its outflowing wind when in close proximity to a storm center may produce heavy gales.
A high and low barometer are inseparable parts of an electric couple. When a storm enters—as the lowest point of depression within an area of low barometer is called—passes over a continent, on some parts of that continent there is an area of high barometer; hence, as no rain falls under a high barometer, the part of a continent covered by such may suffer from excessive rain falls and destructive floods.

At present, for want of adequate knowledge of the laws governing the movements of the permanent high barometer, we can only tell the time when these heavy rain-falls will take place, but not the localities where they will occur.
When observation has furnished us the necessary facts, so that we can deduce the law, we will be able to forecast both the time and place, when and where the phenomena will occur.
A low barometer will swing around as high barometer, as a center, and vice versa.
A high barometer lies about 15 degrees toward the left when we stand facing the point whence the wind comes; and a low barometer lies as many degrees to the left when we are facing the point whither the wind goes.
The direction of a low barometer or storm center if moving, can be ascertained by observing the veering of the wind.

Suppose the wind to be southeast, then if the wind remain steadily in that point, we are in the path of the storm center. If it veers toward the south, the storm center will pass north of us. If it shifts toward the east, and thence north, then the storm center will pass south of us.
Two Swordfish Stories.
Saturday afternoon, says the Honolulu Gazette of September 1st, about the time the frigate Repulse was getting under way, a large fish was seen by the natives of Waikiki rapidly approaching the bay. As he neared the reef he cleared it with one leap of fully two hundred feet and skimmed over the shallow water inside until he landed high and dry on the sand beach, directly in front of Mr. J. W. Pfluger's seaside cottage. Here he was seized by a native, who, however, was unable to hold him, and the huge fish floundered about till he finally got into the water. A crowd of natives corralled him, and the water near shore being too shallow for him to use his fins to any advantage they soon killed him with an ax. It proved to be a species of the swordfish, measuring eight feet in length, while his sword measures thirty-six inches. The latter may be seen in our office. He appears to have been frightened by the Repulse and shot like an arrow through the water and over the reef, with such extraordinary speed that he could not stop till out of his native element and high on the land. Those who witnessed it says it was a most exciting scene.
These sword-fishes are very powerful. We remember Capt. Stone telling of an incident which occurred while he was running the Jeopline between this port and Jarvis Island, about 1858. The brig was an extraordinary sailer, and while going at her full speed, ten miles an hour, she was struck directly under the stern counter with such a shock as to jar the whole vessel and to awaken the captain out of a sound sleep, who supposed the brig had struck a whale or a reef. Immediately the pumps were started but there was no water in the hold. On returning to port the brig was hove out to find the cause of the shock, when, near the sternpost, imbedded in the thick plank, the blade of a sword-fish was found fully twenty inches in length. To have hit the brig under the counter the fish must have been going at the same direction as the vessel; and one may imagine the speed with which it moved to have plunged its sword twenty inches, through the planking. It must have been going at the rate of twenty or twenty-five miles an hour, and evidently intended to hit the brig, supposing it to have been a whale. From this one can get a faint idea of the fights which take place among the monsters of the deep.

A Troubled Barber.
A joke was perpetrated on one of the best artists in one of our best barber shops yesterday, says the Rochester Chronicle, which disgusted the young man very much and made any quantity of sport for his associates. The men were all busy at work when a man entered the shop, took his seat in the corner, pulled out a paper and began to read while waiting his turn. He held the paper up before his face in such a manner that the barber could not see it, and therefore when he had finished his job he sharply ejaculated "Next!" No response from the man behind the newspaper. "Shave, sir!" came next a little louder. Still no response. Then raising his voice rather impatiently, as he was a barber whose chair was never slighted before, he shouted: "Want something done, sir? All was quiet, and the man read on as though he were ten miles from any disturbing queries. "That man's a deaf mute," said one of the artist's fellow-workers. "I know him well; he wants a shave, but don't know as it is his turn." Thereupon the young man left his chair, stepped across the room and touched the quiet man on the shoulder. He glanced up, when the barber began a pantomimic performance intended to represent the operation of shaving, and then pointed persistently toward his chair. "No, thank you," said the mute, "I'm only waiting for a friend."
The look of unadulterated, unmistakable and unspendable disgust on that barber's face as he went back to his chair was painful to witness.

—Rejected lover.—"But couldn't you learn to love me?" Young lady—"I might if—I never saw you again."

The Physician.
The following is from a paper on "The Causes of Typhoid Fever in Massachusetts," published in the second annual report of the state board of health of Massachusetts:
A young butcher, between twenty and thirty years of age, was attacked with typhoid fever. He was a bachelor, and occupied a good sized chamber, lighted by two windows, and having an open fireplace.
The fever was mild, with daily febrile exacerbation, hot skin, thirst, slight diarrhoea and rose spots, with no violent symptoms. There was no inclination for drugs. He was bled two or three times a day with tepid water and was allowed water freely, iced or not, according to his taste. The covering of his body was regulated by his sensations. A slight wood fire, just enough to insure ventilation, was kept in the fire-place, and one of the windows was raised a little.
As soon as his family, who lived in the country, heard of his illness, two of them, a maiden aunt and a sister, came to the city to take care of him. They reached the house one afternoon just after my visit. My patient was, as described above, comfortably sick, with a pulse about eighty, and without delirium. They were frightened to find their relative, who was sick with typhoid fever, so poorly cared for. Guided by their theory of the proper treatment of fever, they proceeded without informing me, to reform matters.
They pinned a blanket over each window, so as to exclude the light, and closed the open window; they closed the chimney with a fireboard and set up an air-tight stove, in which they made a fire. In order to make him sweat he was packed in blankets and hot herb tea was given him.
When I called the next day I found his room dark and filled with hot foul atmosphere. The odor was of that offensive sort that sick chambers are too often charged with. But the great change was in the sick man, whom I had left so comfortable the day before. He was wrapped in blankets, his skin was dry, his lips cracked, his eyes wild, his pulse 120, and he was so restless and delirious that it was all his attendants could do to keep him in bed.
His aunt said she came to nurse her nephew, and had found him with open windows, exposed to noise and currents of air, drinking cold water as freely as he chose, and taking no medicine. These evils she had endeavored to remedy, but in spite of all her efforts he had rapidly grown worse.
The physician states his conversation with the aunt, and his refusal to continue in charge unless everything was restored as it had been on her arrival. The windows were opened, the stove was removed, a fire made in the chimney and the blankets were taken from the patient. He goes on to say:
I gave the sick man a tumbler of water, which he drank as if he were quenching an internal fire. All this they here in silence, but when I called for a large tub, and made preparation for a bath, they remonstrated, and declared that a cold bath would kill him. Remonstrances, however, were unavailing, and my patient got a cool effusion by pouring water all over him. He was then put to bed, tightly covered, and soon went to sleep. By night, his condition had greatly improved, and the next day, twenty-four hours later, his fever assumed its previous mild type, his pulse about eighty and his head tolerably clear. He made a satisfactory convalescence.
The case just related is a fair specimen of a common malpractice, occurring every day, but escaping notice because the effects of carbonic acid poisoning are not brought out in bold relief.

MOCKING BIRD FOOD.—To make a wholesome and agreeable food for caged mocking birds, take one pound of powdered soda biscuits, one pound of ground rice, one pound of ground hemp seed, and four ounces of fine lard. Mix thoroughly and keep in a covered can, or corked bottle. It is ready for use as soon as mixed, and will keep for several months. Feed in a cup or bird dish. The materials must be fresh and of good quality, and the lard must be pure and free from water. It is good for birds of any age. In feeding young birds, it is necessary to moisten with water, but when the bird is old enough to feed itself, this must not be done.

TEA RUSK.—One half pint of new milk, one cup of hop yeast; set the sponge at night; add flour to the above to make a batter; in the morning add one half pint of milk, one cup of sugar, one of butter, one egg, one nutmeg, flour to make it sufficiently stiff; let rise, then roll it out and cut it out; let rise, then bake.

FACTS AND FIGURES.
Every one of the nearly 260,000 CHARLES OAK STOVES now in the hands of as many householders have proved eminently practical, and have kept in order, doing all kinds of cooking quickly, cleanly, and with great economy of fuel and labor.

DR. TUTT'S PILLS require no change of Diet or occupation, produce no griping. They contain no drastic ingredients.
CONSUMPTION CAN BE CURED
SCHENK'S PULMONIC SYRUP.
SCHENK'S WRECK TONIC.
SCHENK'S MANDRAKE PILLS.
Are the only medicines that will cure Pulmonary Consumption.
Specially medicines that will stop a cough will occasion the death of the patient; the sallow, who is checked, will find the stomach and liver clogged, remaining torpid and inactive, and almost before they are aware the lungs are a mass of sores, and ulcers, the seat of which is death.
Schenk's Pulmonic Syrup is an expectorant which does not contain opium or anything calculated to check a cough suddenly.
Schenk's Wreck Tonic is a blood-purifying food, mixes with the gastric juices of the stomach, aids digestion, and creates a ravenous appetite.
When the bowels are clogged, the symptoms of the pulmonary disease, Schenk's Mandrake Pills are required.
These medicines are prepared only by
J. H. SCHENK & SON,
No. 6 corner Sixth and Arch Streets, Phila.
And are for sale by all druggists and dealers.
E. J. HART & CO., Nos. 75 and 77 Chesapeake Street, New Orleans, Wholesale Agents.

Be assured, ye poverty stricken, that the necessity of a vigilant activity is a happier inheritance than that of piles of glittering heart-hardening gold.
LUNG FEVER, common cold, catarrhal fever, and nasal discharge of a brownish color in horses, may be checked at once by liberal use of Sheridan's Catarrh Condition Powders.
This is a reason for coughs and colds is rapidly approaching, and every one should be prepared to check the first symptoms, as a cough contracted between now and Christmas frequently lasts all winter. There is no better remedy than Johnson's Anodyne Linctum. For all diseases of the throat and lungs it should be used internally and externally.

IMPORTANT IMPROVEMENT IN TREATING RUTHERFORD'S Elastic Truss Company have produced a great revolution in the treatment of hernia. Their new Truss is worn easy a night and day; adapts itself to every motion of the body; never displaced by hardest exercise; retaining rupture comfortably, till soon permanently cured. Sold at the office of the Company, No. 683 Broadway, New York City. Trusses sent by mail. Send for circular.
