Health For All

Atomic Energy Works For Health

Scientists have found that by labeling a substance they are studying with radioactive isotopes they can follow its behavior more accurately than ever before. These isotopes are byproducts of the manufacture of atomic energy and are allocated for research by the U.S. Atomic Energy Commission.

A group of investigators at the University of Chicago has been studying the action of Isoniazid, a drug used in the treatment of tuberculosis. They first discovered that tuberculosis germs susceptible to the drug became radioactive when the drug was labeled with an isotope named Carbon 14, whereas resistant germs did not become radioactive. Now they are able to study just how Isoniazid attacks the susceptible TB germs. With this information, doctors treating TB will know better how and when to use the drug to help TB patients.

This is only one of many medical research projects in which radioisotopes are being used. The scientist is able to study things beyond the power of the microscope yet invented. These test tube experiments may seem far removed from the problem of the tuberculosis patient lying in his hospital bed. But because of them, the doctor knows more about his disease, the germ that causes it, and the means of curing it.
