

Clinton-Lydia Mills to Offer Tetanus Toxoid to Employees

Tetanus (Lockjaw) germs may be acquired from tools if the person has an open scratch or unprotected wound. This is true of tools at work or in the yard at home. Puncture wounds are especially dangerous. After an injury unprotected persons require tetanus antitoxin which sometimes produces violent reactions. Upon recent advice of our Doctors, Clinton-Lydia Mills will soon offer Tetanus Toxoid to all employees. Tetanus

toxoid rarely produces a reaction and is very mild even then. Tetanus toxoid is effective as a preventative. Unlike anti-toxin, tetanus toxoid closes the door before infection. The antitoxin lasts only 2 to 3 weeks while the toxoid is permanent as long as booster shots are maintained. Two shots are needed to produce immunity with a booster shot to follow every 5 years. Details of the program will be announced later.

"locked". That is why the disease is popularly known as "lockjaw". Once the disease has become established in the body, the only treatment is an injection of Antitoxin. Even if all possible care is given the patient and treatment is immediate, the disease may become fatal.

YOU CAN Avoid Mr. LOCKJAW

There is a way to become free from the worry of possible Tetanus infection: have inoculations of Tetanus Toxoid. Two shots of Toxoid are given you a month apart. Then, every 3 to 5 years you return to your physician for a "booster" shot to maintain your immunity at a safe level. The Toxoid causes you to

build up an immunity against any Tetanus infection you may get and live Tetanus germs are destroyed before they can increase in your system and become active. It is as simple as that and the immunity you acquire is effective. It is important to report to your physician at the time of injury for proper local care of the wound and his advice whether or not a booster is necessary.

TETANUS TOXOID Versus Mr. LOCKJAW

The use of Tetanus Toxoid is not new, nor is it experimental. It is a time tested and totally reliable preventative against Tetanus. Without it, many soldiers in World War I died from Tetanus infected battle wounds. It was, however, available as a preventative in World War II, and due to its effectiveness, hardly a case of Tetanus was seen.

There is nothing dangerous about taking Tetanus Toxoid shots. For years pediatricians have given preventative Toxoid shots to children and babies with the result that untold thousands of lives have been made safe from the dread disease.

... and This Is Important !!

If you are not now protected by tetanus toxoid don't wait any longer to obtain the effective protection that its active immunization will give you.

Actually, he's a dangerous fellow to tangle with and we hope you never meet him. But, of course, there is always a chance that you may. He's a germ that doctors call TETANUS. An outlaw of the worst kind, he is everywhere, and is always waiting to step into an open scratch on your skin or into a fresh wound of any kind. So it is a good thing to know something about him and to know how you can prevent him from attacking you.

Mr. LOCKJAW GETS Around

It is definitely known that Tetanus germs breed in stable manure, but that does not mean that only farmers and country people are in danger of Tetanus infection. Tetanus germs are carried to cities or communities in various ways: in the dust or mud on people's shoes, in earth adhering to vegetables like potatoes, in loads of manure for private gardens, on the unwashed hands of people. It is amazing how the Tetanus germ gets around until he is everywhere.

Minor wounds are sometimes a dangerous source of infection. Factory workers can acquire Tetanus from tools if they have an open scratch or an unprotected wound. Persons using garden tools or even working in a florist shop are exposed. Deep wounds resulting from stepping on a protruding nail in a board on the ground or from running a wood splinter into hand or foot are wide open to infection. People wounded in auto accidents often become victims of Tetanus, especially if passengers or driver are thrown onto the custy pavement or onto the earth or gravel shoulder of the road.

WHAT Mr. LOCKJAW Does TO YOU

After a wound has been infected with Tetanus germs, it takes from 2 to 3 weeks for the germs to incubate and become active in the body. By then the disease has taken hold of the victim, and all of the muscles in his body are affected by painful spasms. The muscles of the jaws contract and become

Clinton News . . .

(Continued from page 4)

Mr. and Mrs. James Page and family visited Gatlinburg, Tennessee and Cherokee Indian Reservation.

Mr. and Mrs. Fred Stevens of Laurens spent their vacation at Daytona Beach, Florida.

Mr. J. E. McLendon visited the Isle of Palms in Charleston during the week of the Fourth of July.
