high, and the work thorough. The three schools in Broadaway Township, taught by Misses Zella Campbell, Allie Major and Lizzie H. Anderson, are three as good schools as can be found in the County. These young ladies are doing a work that is appreciated, and that will aid wonderfully in raising the people of this Township to a higher plane of intelligence and civilization. The work in these schools demonstrates what teachers can do. Finally, the teachthese teachers told us she had never lost a dollar of her tuition charges. Neither of these teach for what the public pays, but have their regular terms, and credit

The school at Calhoun, in Belton Township, has as teacher Miss Mary E. Henderson, one of the most enthusiastic teachers we have ever met. She is full of energy, and a faithful and efficient worker. The school house is kept neat and clean, and the pupils have well prepared lessons. Calhoun is one of the best locations in the County for a school. and the people are well able to pay for the education of their children. The plan for a school at Calhoun should be changed a little. The patrons should make up, as it is termed, a school, each subscribing as many scholars as will be sent, at a fixed rate of tuition, and let the school run at least eight months. The teacher will draw the public funds and give credit for it to the patrons, and thus diminish their subscribed tuition.

Best and Cheapest Method of Im- treatment, to have good crops of both proving Worn-out Lands.

The following is an essay by Maj. Howard Swineford, read before the Tuckahoe Farmers' Club, and published in the Southern Planter :

To the practical farmer there is no more interesting or important subject than the best method of restoring worn out lands. The fact that they are worn out implies that they were once fertile and producing crops. Such lands are worthy the attention of the farmer, and are more easily brought back to their former value and fertility than to cultivate lands naturally poor and which require building up and constant feeding.

While these may seem too poor to grow even a crop of stunted weeds, yet there are elements in the soil which are ready to do good service when permitted to do so. For instance, as long as the seed lies dormant in the land you cannot kill it: but make the soil mellow by turning it up for the action of the lifegiving sun, air, and showers, then notice, f you will, the generation of millions of weed seeds.

This vital help of nature's ever ready laboratory is what every farmer has when huilding up the waste places. The first growth of volunteer vegetation may not be strong, but the turning of this small crop of weeds will furnish more strength to each successive crop. If this be repeated a number of times, the land will at last have received sufficient substance to furnish food for other crops. This is, however, a slow process, but within the reach of all, for the thorough breaking up of the soil is all that is needed-nature does the rest.

The application of manures and fertilizers of various, kinds in large quantities is a more speedy process, but also an expensive one; and while it may be the best for the aggressive farmer, it is not the cheapest, and this is one of the points asked after in our subject, and one of immense importance to the average

The practice of growing crops for the purpose of plowing them under to fertilize the soil is one that, in my opinion, has a very much greater advantage than any other, and there is no better way of cheaply improving it than this. To procure a sufficient supply of manure is, at the best, a very costly process, but a crop that may be easily grown in a few months and then turned under, may furnish to the soil as much fertilzing matter as eight or ten tons of manure per acre, and this process may be repeated several times in one year.

Manuring with green crops is not only the most economical, but, to most lauds, one of the surest and most speedy means properties of the soil. Besides furnish. ing plantfood, the soil is made more mellow and better fitted for producing other crops. Various crops are used for this ourpose; some of course, are more valuable than others. If we may be permitted to place two at the head of the list as most valuable, we would name red clover and the cowpes, the former for general use and the latter as best suited to this locality. Among the numerous other crops used for this purpose are buckwheat ye, oats, corn and millet.

The Hon. George Geddes, well known throughout the United States as a practical and scientific farmer, says of the clover: 'If our soils require improving, we turn the clover crops under and repeat the operation until there is sufficient fertilty to allow us to carry the clover off. The oftener we can fill the soil with roots and then plow them under, and thus allow them to rot, the sooner do we expect to get our land in condition to bear a crop of grain. A very considerable part of the cultivated land in Central and Western New York has never had any other manuring than this clover and gypsum and its fertility is not diminishing." He states that he had a field, which for seven ty-four years, had been manured with nothing except clover grown upon it, and plowed in and that this field had produced wheat, corn, oats barley and grass The clover thus used had, for fifty years been regularly treated with gypsum, and that the land was constantly increasing

Our own Dr. Pollard, late Commission er of Agriculture, gives the following direction for improving partially-exhausted lands in the Southern States by the use of vegetable manures:

"It may be said that a considerable portion of our lands are too poor to produce clover or even a crop of grass Then let 200 pounds of ground South Carolina phosphate and 300 pounds of kainit (Dr. Ravanel's ash element) be applied to the land and peas seeded. when grown, turn these peas under and sow clover, with wheat or oats, if be limed after the peas are turned under. But if the farmer cannot get the 'ash and knit and sew. It is all done by ma- element,' let him sow peas or rye early in keepers provide for the future and do not chinery now. There is no woman who the fall, or oats early in the spring, turn allow themselves to impose upon the

Atlanta Constitution. "Qui fit Macenas" is nearly all the Latin I remember. It is the beginning of an ode that Horace wrote nearly two thousand years ago. He was ruminating over the dissatisfaction of mankind with their lot, their condition, their occupation, and he wondered why it was that most everybody imagined his own case a hard one, and that other people were better off. Ever since then history has been

The boys and girls that uster romp in the

> But so is progress, it must be, and it is every fellow's business to keep along with it, but I study over it and now and then I set down and try to figure out as

The oxen has gone, the mule and the horse must go, is the way I figure for the future. The sweet meadows of the stock raising districts, where the young colts kick up their heels in playful glee must be turned to some other purpose. Like the ox the mule must go to the wall, and as the coming generations skim along with electricity for the motive power, there will be old folks who will look back

there is any way better than the old way,

for the most pleasant feelings of my boy hood was when I walked barefooted in He dug down until he came to two the fresh turned soil behind the plow and jerked the single line along old "Ned's" sides. But such work won't do for these days. While it took me and "Ned"-'Ned" was the mule-a whole day to break an acre, and that was counted good work, it won't do for these times. Where a hand uster break one acre he must now break four to keep up with progress-one hand now must do as much work as four hands uster do. This is the "problem" and farmers must solve it. If in the use At each end of the hall is a lake. One of machinery is the only way to accom-
