Women Have Been Telling Women for forty years how Lydia E. Pinkham's Vegetable Compound has restored their health when suffering with female ills. This accounts for the enormous demand for it from coast to coast. If you are troubled with any ailment peculiar to women why don't you try Lydia E. Pinkham's Vegetable Compound? It will pay you to do so. Lydia E. Pink-ham Medicine Co., Lynn, Mass.

Waistcoat a Monarch's Fad. Historians tell us that Charles II. & England made a resolution to change the fashion of his dress to one which he would never alter, and communicated this decision to his council in October, 1666. From a diary of that period we read: "This day the king begins to put on his vest, and I did see several persons of the house of lords and commons, too, great courtiers who are in it, being a long cossack close to the body, of black cloth and pinked with white silk under it."

Screwing up the Eyes.

Disastrous to the beauty of a child's expression is the habit of screwing ur -the eyes. The trick points very plainly to defective vision and calls aloud for a visit to an oculist. The visit must not be delayed, for ugly wrinkles around the eyes is the least evil of this defect. A short-sighted child is severely handicapped when it begins in school life, and neglected myopia leads to serious eye trouble in later life. Properly prescribed spectacles are all that is required to end this

FORAGE CROPS FOR THE PIGS

Question of Feeding Is Most Important in Economical Production of Pork.

For economical production of pork with forage crops, the question of feeding is one of the most, if not the most, important consideration. The best forage crops will do little more than maintain swine. On the other hand, it is apparent that if hogs are getting a full feed of grain they will not make the best use of the forage. The amount of grain to feed, then, is a question of great importance. From experimental work it has been determined that the greatest economy of forage is brought about when one-

half to two-thirds cf a full feed of grain. Under ordinary conditions, this would mean that the hogs should he fed grain to the extent of two to three per cent. of their live weight. In other words, a shoat weighing 100 pounds would be fed two to three pounds of grain per day. From gains made by hogs so fed it has been calculated that under average conditions a gain of three-fourths of a pound per hundred weight per day might be expected by such feeding.

When forage is abundant and fresh very little grain is required. On the other hand, as the season advances and the forage becomes less plentiful it becomes necessary to increase the amount of grain to produce the destred grow
