Children Cry for Fletcher's

CASTORIA

The Kind You Have Always Bought, and which has been in use for over 30 years, has borne the signature of and has been made under his per-Chart Hutchert - Allow no one to deceive you in this. All Counterfeits, Imitations and "Just-as-good" are but Experiments that trifle with and endanger the health of Infants and Children-Experience against Experiment.

What is CASTORIA

Castoria is a harmless substitute for Castor Oil, Paregoric; Drops and Soothing Syrups. It is pleasant. It contains neither Oplum, Morphine nor other Narcotic substance. Its age is its guarantee. It destroys Worms and allays Feverishness. For more than thirty years it has been in constant use for the relief of Constipation, Flatulency, Wind Colic, all Teething Troubles and It regulates the Stomach and Bowels, assimilates the Food, giving healthy and natural sleep. The Children's Panacea—The Mother's Friend.

GENUINE CASTORIA ALWAYS

In Use For Over 30 Years The Kind You Have Always Bought

THE CENTAUR COMPANY, NEW YORK CITY,

Uses and Abuses of Fertilizers By Prof. R. J. H. De Loach, Director of Georgia Experiment Station.

2. INTELLIGENT USE OF FERTILIZERS IN GERMANY. The Second of a Series of Six Articles.

All state institutions have fostered the fertilizer trade since its origin in the early fifties. State organizations of all kinds have taken a lively part in the building up of the trade, and in later years the states have taken Solution of Dipping Problem Solvedit for granted that the trade is profitable to farmers and merchants alike, and have therefore framed laws to regulate its manufacture and sale. In every state where fertilizer is sold in appreciable quantities laws have been passed exacting certain requirements of the manufacturer, as to analyses, grades, etc. Besides the trade; over-ambitious, might forget its obligation to the consumer and offer for sale inferior material under the name of fertilizers. We may say without fear of successful contradiction that the states themselves are largely responsible for the rise and volume of the health of the hog. We have presented fertilizer trade.

It has long been recognized that Germany leads the world in many lines of science. This is perhaps true in regard to the use of fertilizers in early years. Germany discovered that mineral salts applied to growing crops increased the yields immensely, and gave time and study to the underlying causes, and has suggested to the other parts of the world many valuable lessons on her findings. Von Liebig, through his studies and lectures on modern agriculture, has made known much of the work of Germany in the early history of the use of commercial fertilizers. Liebig says that Kuhlman, a German agricultural scientist, applied salammoniac to a meadow in the years 1845 and 1846, and found that on a hectare (21/2 acres) he gathered 8,140 pounds of hay more than on the same kind of meadow where he did not use the salammoniac. He secured this result by using about 200 pounds of salammoniac to the acre.

In commenting upon this Von Liebig has the following to say: "It is quite certain, that in the action of the guano, which produced the crop next highest after the Chili saltpeter, an unmistakable part was played by the ammonia contained in it. On the other hand, however, the experiments with carbonate and nitrate of ammonia show that a quantity of ammonia, or nitrogen, equivalent to that in 20 pounds of guano and employed under the same conditions, was almost without effect."

Fertilizer Experiments In Germany.

A little further along he says: "The most recent observations on the comportment of the soil towards the food of plants show how slight is the knowledge we possess of their mode of nourishment, and of the part which being manufactured in increasing the soil, by its physical condition, plays in it. The comportment of the numbers to meet the popular demand salts of ammonia, of chloride of sodium, and of nitrate of soda, towards for something of the kind. Here is the earthly phosphates in the soil, may perhaps assist us in throwing one that works on a little different some light on their action, or one of their actions, on the growth of plants." This statement was made because it was always found that when common hog rotates the barrel of the cylindrisalt was added to certain mineral manures, greater yield was obtained, and Von Liebig came to the conclusion that this was due to the relation of little oil is released to run down to this added material to the liberation of potash in the soils.

Only a short time after the war between the states the German potash beds were discovered and by rapid leaps and bounds this material gained in favor with planters as well as experimenters. The necessity for finding a combination to liberate the potash in the soils was now removed and thorough satisfaction was found in the use of the nitrate of soda and the potash salts, and here the industry stood for a long time. Liebig does claim, however, that Tribasic phosphate of lime crept into the formula and was found efficient. This fact is very significant and happened to be dis covered by a constant study of the use of the nitrate of soda and potash salts. Liebig thought that these two plant food materials had the power of dissolving phosphoric acid in the form of earthly phosphates, and these in turn added greatly to the yield of farm crops.

Germany's Crop Yields Greater Than Other Nations.

We have here many hints of what afterwards really developed to be facts-namely that the three great elements of plant food that should be applied to the soil for good crop yields are phosphoric acid, ammonia and potash. For many years these three elements have been the essential elements of plant food in a fertilizer formula.

Today Germany applies more mineral salts per acre to her crops than any other nation in the world, and partly as a consequence gets higher yields of farm crops than any other nation. It is significant that these two facts are so closely related, but it must be remembered that Germany has learned the lesson of good tillage-deep plowing, the proper use of vegetable matter in the soil, and the dangerous practice of continuous cropping with any single crop. It is also to be remembered that the lands on which the most money can be cleared without any kinds of fertilizers are the lands that will give greatest profits with fertilizers.

TURNING SILAGE INTO BEEF

It Cannot Be Considered as Substitute for Other Necessary Materials in Animal's Ration.

The word "silage" at one time suggested only brimming milk pails and big milk checks. Nowadays it is as well a big factor in putting the finishing touches on choice sirloin beef. Silos are common in the beef feeding sections of Wisconsin. The main reason for feeding silage to beef cattle is economy of production. It cannot be considered as a substitute for other necessary materials in the ration, according to J. L. Tormey, College of Agriculture, University of Wisconsin, who gives a few suggestions as to the feeding of silage for beef production under local conditions.

"Clover or alfalfa hay should be fed along with the silage in the .winter. If clover or alfalfa hay is not obtainable, use timothy or mixed hay. In addition to the corn silage and hay allowance, about three or four pounds of cottonseed meal for each 1,000 pounds of live weight of the animal should be fed daily.

Tru-year-old steers weighing about ,000 pounds may be started on about 20 to 25 pounds of silage, 6 to 8 pounds of clover or alfalfa hay, and 5 to 6 pounds of a mixture consisting of six parts of corn to one part cottonseed meal by weight daily. In a period of two weeks the cattle may be brought up to full rations, if carefully watched. At this time they will eat about 15 to 20 pounds of silage, 5 to 6 pounds of hay and 12 to 14 pounds of grain mixture daily.

"As cottonseed meal is rather high priced this year, wheat bran or gluten feed may be used instead with almost as good results and at a saving in cost of production."

OIL ON THE TROUBLED HOGS

principle than the others. As the cal stem the knobs hit the trip and a the hog's hide. The slope of and angla at which the "post" stands makes it possible for the hog to get oil on any part of its body-top, bottom, sides or ends.-Farming Business.

BUILDING DOG-PROOF FENCE

Most Economically Constructed by Setting Posts Ten Feet Apart-Put Barbed Wire First.

A dog-proof fence can be economically built in the following manner: Posts are set ten to twelve feet apart and a barbed wire is first stapled to them right on the surface of the ground. Three inches above this is placed a panel of close-woven wire, 36 inches high, and about this two strands of ordinary barbed wire. Care should be taken to see that there are no openings between the ground and the lowest barbed wire. An inclosure made in this manner, into which sheep may be turned at night, is inexpensive, and dogs will not go through it. Most of the damage by dogs is done at

Coughs and Colds Not to Be Neglected

Anyone will realize the seriousness of neglecting a cold if he observes results of such neglect among his acquaintances. How often have you heard, "He caught cold, didn't do anything for it and it turned into"—then some dreaded disease is named. some dreaded disease is named.

Ordinary colds yield to prompt treatment at the beginning. That is why every family should be supplied with a reliable cough medicine—or that will heal raw and inflamed surfaces, loosen the phlegm, allay irritation, ease the hoarseness and stop the tickling sensation in the threat that does not permit one to sleep.

Foley's Honey and Tar Compound is invaluable for relief of coughs, colds, croop, whosping cough, tickling in threat, tightness or soreness, grippe or breachful coughs. It contains no barrain ingredient, It is nothing, coething, efficient and pleasing.
