The Herald and News. NEWBERRY, S. C.

PESTIFEROUS INSECTS.

Modes of Combating Them Successfully-Valuable Suggestions,

[From the Atlanta Journal.] A larger number of insects are visible in summer than in winter. With the advent of cold weather insects seek sheltered retreats, become dormant and, therefore, invisible. In addition some are killed by cold, others fall a prey to their enemies, and as propagation ceases during their winter sleep, the places of those that perish are not filled. For above reasons comparatively few insects are seen in the early spring. when returning warmth awakes them

to life and activity again. Insects pass through the winter in several states or conditions, as mature insects-as pupae or chrysalids (a strange intermediate between the worm and full grown insect), as worms or grubs, and as eggs. When cold weather sets in mature insects hide themselves in the hollows of trees and stumps, under the bark of those that are dead, in cellars and garrets of houses, under rocks and in other sheltered places, and some burrow in the earth. Pupae are found suspended from the limbs of trees, the rails of fences, and in openly build outhouses. Mature insects and pupae are especially liable to attacks of birds,

like the wren, and other enemies. Grubs and worms generally burrow in the ground, and make for themselves smooth-walled cavities in which they coil up and sleep through the winter. Thus domiciled they resist severe cold with impunity, but if their cells are disturbed by plow or spade and they are placed in direct contact with the pulverized soil they perish. This has been demonstrated experimentally in the case of cut worms at one of the agricultural experiment stations, and is an important practical fact to the gardener and farmer.

It suggests a very simple and practicable method of attacking these troublesome customers. Worms and grubs in the ground, if undisturbed, are better protected from cold than grown insects, or pupae, and are also less liable to attacks of enemies. The much abused mole is the gardener's best friend in destroying these underground pests, as the true mole, contrary to general belief, feeds entirely upon insects.

It is generally believed that very cold winters are particularly destructive to insects. In some instances this may be true, in others it is not. It is true of insects that pass the winter in their full grown state. But to those that pass it as pupae, a warm winter may prove more destructive than a cold one, develop into full grown insects, and these, not finding the food they live on a safe to be easily opened. that season, perish. If severe cold destroys insects generally, very cold countries should have few of them, but such is not the case. Insects abound in Canada as well as in Georgia.

As stated already, comparatively few insects are to be seen in early spring, when returning warmth awakens them to new life and brings them out of their retreats. The reason of this we have already given. Reproduction stops in winter, but cold and enemies continue their work. Those that survive, however, begin at once the work of reproduction. As the life of a generation, in case of many insects, extends through a few weeks only, they multiply with great rapidity. It is obvious, that the best time to make war upon insects is in early spring, when they are least numerous. We desire especially to emphasize this point.

In cities two of the most troublesome insects are the housefly and the mos quito. The housefly passes through the winter in its adult stage. It seeks the safest and warmest retreats it can find, remains dormant during very cold weather, but comes out occasionally during exceptionally warm spells. Many that went into winter quarters perish and few comparatively appear in spring. If everybody would destroy the small number first observed in spring, thi pest could be kept within

bounds much more easily afterwards. In early spring fly-paper and other fly destroyers are especially in order, and will do vastly more good then than at a later period. Pyrethrum or insect powder thrown into the air of a closed room will quickly stupefy, if it does not kill, all the flies in it. They will soon drop on the floor, and should be swept up and burned. The writer has used this powder freely for many years to get rid of flies, and with most satisfactory results. If the first flies that appear in spring are not destroyed they begin at once to multiply with great

A few weeks only elapse between the laying of the egg and the appearance of the full grown fly. Its eggs are laid in the accumulations of horse and cow stables. If kerosene is sprinkled freely over such accumulations every few days it will destroy both the eggs and the newly hatched maggots. This emulsion is made by dissolving a fourth of a pound of hard soap in a quart of boiling water, and while it is still hot adding one pint of kerosene and stirring vigorously until a thorough mixture results. This mixture should be kept in stopped jugs or bottles, and when to be used diluted with fifteen times its bulk of water. The free use of this emulsion is earnestly recommended to those who keep stock in the city. The early spring is the time, and the breeding place (stable) is the point in which the main attacks upon the fly should be made.

Mosquitoes also bridge over the winter in their adult state. Most of them perish during the winter, for whilst large numbers may be observed late in autumn, very few are to be seen in early

The writer has seen only one mosquito so far this spring; it was attempting to escape from his dwelling through a glass door. The survivors, though few in number, in a climate like that of this city, begin to multiply as soon as the weather is warm enough to develop activity. They deposit their eggs in little, boat-shaped clusters on the surface of stagnant or comparatively still water. These float until the eggs hatch into "wiggles" or "wiggle-

tails," which sink in the water and live in it until ready to be transformed into the perfect insect.

From the laying of the egg to the appearance of the full grown musquito fifteen to twenty days only are required under favorable conditions. Note how rapidly, therefore, they can multiply. The "wigglers" have a respiratory tube, the end of which is protruded just above the surface of the water when they need air for breathing purposes. This arrangement renders it easy to destroy them. A thin film of kerosene on the surface of the water they inhabit will do the work very effectually. But the first step to be taken in fighting mosquitoes is to get rid of al' still or stagnant waters; such as lagoons or pools connected with streams, unused wells, waters in hollows dammed up by fills, rain water collécted in barrels,

etc. Our city authorities should have their attention called to the importance of seeing that no such bodies of water exist within the city limits. During the past autumn the lagoons connected with Butler street branch filled north Atlanta with mosquitoes. In the few instances where the expense of getting rid of stagnant waters by filling may be too great, they may be rendered harmless as breeding places for mosquitoes by floating them with a thin film of kerosene at intervals of two weeks during the summer months. " expense would be very trifling.

Aside from the matter of personal comfort in securing freedom from the bite of mosquitoes, the above might be urged on sanitary grounds also, for it is possible that contagious diseases may be communicated from one person to another through the proboscis of a mosquito or the tongue of a fly. The lancet of a mosquito is quite as good an instrument for inoculation as that of the surgeon, and the tongue of a fly that has sucked the virus of sm 1 pox or other virulent diseases, may deposit the same on a sore or wound of another individual it visits. It is not at all impossible that in some instances epidemics of contagious diseases developing in in localities without communication with diseased centers, may have originated through the agency of insects. W. L. Jones.

Atlanta, April 1, 1892.

BURGLARS AT NINETY-SIX.

They Crack a Safe and Secure \$800

[Special to The State.] NINETY-SIX, S. C., April S .- Last night the store of E. M. Lipscomb & Co., was broken open and the safe rob-

bed of about \$800. Mr. J. R. Dover, a cotton buyer here, lost \$400, E. M. Lipscomb & Co., \$300, A. W. Still \$75 and J. C. Hutchison \$25. The robbery was no doubt committed by professionals, as a hole was drilled into the safe just above the combination, then because warm spells may cause pupae to a steel spike was drilled in, knocking the lock out of position, allowing the Two suspicious looking parties, well

dressed, who have been lying around here for several days, have disappeared, and it is thought they are the ones who committed the robbery. Citizens have been scouring the country in every direction, but as yet has been unable to run up with them.

A reward of \$200 have been offered for the burglars, with proof to convict.

BLAINE AS A CANDIDATE. The Opposition to Harrison's Nomination Growing.

[Atlanta Journal.]

WASHINGON, D. C., April 7 .- There is a great revival in republican circles of Blaine talk, while the opposition to Harrison is steadily increasing. Blaine is quoted as saying that he was hounded by every agency of the administration into writing his letter of declination. He leaves the inference that he is sorry he wrote it and that though he fears he could not be elected with the administration against him, he is willing to make the riffle if the G. O. P. calls for

his services. Senator Quay asked two Western senators to-day if they believed that Blaine would accept the nomination if

They replied that they could vouch for his doing so. Quay responded, "In that event he can depend upon the entire electoral vote of Pennsylvania and of New York as well."
