Parisian Information Bureau.

An information bureau has recently been inaugurated in connection with the University of Paris, and is considered an excellent innovation. The bureau will afford information on all matters connected with higher education in Paris, whether in government or private institutions. Those who, in this country or elsewhere, are contemplating entering the university, and who have spent hours in trying to derive some tangible idea from calendars and class syllabuses will appreciate the useful purpose which would be served by a bureau of this char-

Measuring Sunshine.

Supshine is to rare in England that the government takes great care to measure it. The official summing up for 1903 as regards sunshine shows that all districts in the British Isles, with one exception, fell short of the average. The exception was England northwest, including Manchester, that curiously had an excess of fifty-seven sunny hours. In Scotland north, west and east the deficit was eighty-one hours, forty-eight hours and 133 hours. England northwest and east were short 107 hours and 139 hours, while in England south and southwest the deficit was sixty-eight hours and 115 hours. The Midlands were behind by ninety-eight hours. In Ireland north and south the shortage was eighty-one hours and 113 hours. Commonly the islands in the English Channel have a large share of sunshine, but last year they went short by 135 sunny hours.

The devil's guns cannot be trained on those who stand on the mount with God.

SOUTHERN * FARM * NOTES. TOPICS OF INTEREST TO THE PLANTER, STOCKMAN AND TRUCK GROWER.

Seed Wheat For Next Year.

The Progressive Farmer often has occasion to cull strong and valuable farming articles from Wallace's Farmer, and in its last issue we find another editorial which we must pass on to our readers. Says Dr. Wallace:

"If the farmer is to succeed he must keep a good lookout ahead. His plans necessarily take in one or more years' work. He must have a definite system of rotation, should know where he is to put wheat and corn the next year and the year after, and in what years certain fields should be down in grass. If he is to improve his crops he must

improve his seed from year to year. "Sowing wheat, whether for winter or spring, is a good ways off, but it is not too early to call his attention to the method in which he will secure the best seed. Whether he is growing winter wheat or spring wheat he should, in our judgment, select the best acre, or five acres, according to his requirements, while it is yet growing and ripening in the fields, and when it is fully ripe cut and stack it, and put it in his barn by itself. He should let it go through the sweat, and when the proper time comes thrash it by itself, taking care that there is no mixture from previous thrashings of any kind of either inferior seed or foul seed.

"Before seeding time comes he should provide himself with a good fanning mill, a grader if possible, and without regard to waste or expense, blow out and sift out all small, immature, light weight or damaged seed. He should next provide himself, if the fanning mill is not provided with them. with some screens that will allow all except the very largest and plumpest grains to pass through them, and these alone should be used for sowing his seed for the crop of next year. If time does not permit him to make this careful selection, this final sifting, for the whole of his seeding, let him carefully sift out enough of the larger seeds to sow a part of the field from which he intends to take his seed for the crop two years hence. Let him put this on his best land and give it the most thorough culture. If any of our readers will parsue this policy for five years, they will not complain of seed wheat running out.

"Why do we suggest this method? First, because the largest grains usually grow on the largest and most vigorous stalks or stools. They have a habit of growing large, and this habit, like all other inherited tendencies, is exceedingly valuable to the man who wishes to grow a large crop. Secondly, the larger amount of starch and gluten stored in the scain as food for the germ after it has begun to grow will push it forward rapidly, giving it a vigorous start and enabling it to ences that would tend to weaken the

crops are grown with profit, the cost of planting, caring and harvesting this crop is of the greatest interest. Mr. W. H. Erwin, one of the pioneer potato growers, and who has successfully planted potatoes here for fourteen years, gives the following estimate of putting in an average crop of potatoes in the spring on one acre of ground: Seed, at \$3 per barrel......\$12.50 Fertilizer..... 25.00 Labor.... 5.00 Fifty barrels, at twenty-five cents 12.50 Harvesting and delivery to the depot, twenty cents per barrel 10.00

The average price received by growrs rangers from \$3 to \$4 per barrel for No. 1 potatoes, and from \$2 to \$3 per barrel for No. 2 potatoes.

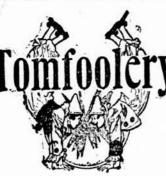

The range of production is from thirty to seventy-five barrels, although in many instances still better results have been obtained. Growers generally, however, prepare to care for fifty barrels to the acre. Mr. Erwin's crop last year, which was an "off year," averaged him tifty barrels to the acre in a crop of some sixty acres.

Mr. Erwin states, however, that it is not quite fair to charge up the entire cost of the fertilizer to the potato crop, as the ground without further fertilizer produces a generous second crop of sweet potatoes, crab grass hay, cow peas, corn, velvet beans, or other crops that can be matured and taken. out in time to allow planting the same ground in the spring.

Erwin has planted Irish potatoes successfully on the same ground for thirteen consecutive years, besides occasionally putting in a fall crop of potatoes on the same soil, and there appears to be no diminution in the yield.

How to Get the Model Cow.

Query: How are you to get this cow? In order to get her in perfection, you must go back to several generations of grandmothers. For if they have not a record for making butter and superior milking qualities, even a good mother and sire will not always redeem them. A line of great performing grandmothers is the true secret of breeding. You may also have the best mother in the world, and unless bred to a dairy site you may get a much poorer cow than herself; hence the truism, "The sire's seventy per cent. of the herd," and by a dairy sire I mean one with those long lines of grandmothers on both sides; all must be record cows on both sides for several generations. The sites should have practically the same dairy points as the cows, his daughters follow him instead of the lame, as usually with well developed rudimentary teats, and general feminine appearances, except the head and neck, should be more withstand climatic and other influ- masculine. Remember one of the often quoted fallacies about the dairy cow plant. A great deal depends on the is, "That the corn crib cross is the wouldn't go as far as that. But perplant getting a good start and grow-best cross for a cow." Many young haps if you dressed them differing off vigorously from the very be- breeders fall into this sad error, entlychiefly, I think, because when at fairs and other show places they see fat count so much. This may meet with approval by beef feeders, but should never be allowed in judging a dairy cow, for she very evidently cannot do both, turn her feed into beef and butter at the same time, and it usually costs as much to make a pound of beef as it does a pound of butter, and we all know which is worth the most in the market. It is blood, i. e., proper breeding that tells at the milk pail and butter table. You can increase your flow of milk by feed, but not the contents of butter fat. To do that you must have the proper line of breeding to fix the butter fat; process of assimilation and evolution. Many a cow has been discarded because she would only give two gallons of milk per day, and a cow kept that gave four, yet the two gallon cow made the most butter. But what we want is the four and eight gallon cow, and then see by proper breeding she shows up four to five per cent. butter fat, then you will have a paying cow. The two gallon cow gives too little even if it is five per cent. fat, for she will only make about three-quarters of a pound of butter, when the cow with a large flow often compensates if she has only three per cent. butter fat, as her offal News. milk can be fed to the calf, pigs, fowls, etc.-I. C. Wade, Habersham County, Ga.

THE FAMILY

I Ŗ

Mrs. L. C. Glover, Vice-President Milwaukee, Wis., Business Woman's Association, is another one ef the million women who have been restored to health by using Lydia E. Pinkham's Vegetable Compound.

" DEAR MRS. PINEHAM : - I was married for several years and no children blessed my home. The doctor said I had a complication of female troubles and I could not have any children unless I could be cured. He tried to cure me, but after experimenting for sev-eral months, my husband became disgusted, and one night when we noticed the testimonial of a woman who had been cured of similar trouble through the use of Lydia E. Pinkham's Vegetable Compound, he went out and bought a hottle for me. I used your medicine for three and one-half months, improving steadily in health, and in twenty two months a child came. I cannot fully express the joy and thankfulness that is in my heart. Our home is a different place now, as we have something to live fo., and all the credit is due to Lydia E. Pinkham's Vegetable Com-**DOUND.** Yours very sincerely, MRs. L.C. GLOVER, 614 Grove St., Milwaukee, Wis." ginning of its existence. "There are among our readers many

retired farmers and those past middle age with more or less leisure time on their hands. It will pay these men to follow a method involving considerably more labor than the one we have suggested, but which will produce the very best results; namely, spend some time in their wheat fields when the grain is about ripe and select by hand the largest and best filled and most perfect heads, enough of them to produce a peck of seed. Plant this by itself, and note results. By following this up for a few years a variety of seed can be procured vastly superior to the seed which they have been sowing, in fact, almost a new variety. It is possible in this way to greatly improve the type and quality of any sort of wheat or other grain, and develop what is really an improved type, much superior to the stock with which they began. This has been done many times and can be done by any good farmer who knows a good head of wheat growing on a good, vigorous stalk, when he sees it."

What It Will Cost.

It may be that some of our readers, who have not yet grown a crop of Irish potatoes, are considering the matter of putting in such a crop next winter. If so, they will probably find some interesting in formation in the following estimates from the Hastings Farmer and Trucker:

By request the following estimate of planting Irish potatoes based on having everything done as published.

One of the first things that a prospective settler would naturally want to find out, before locating in Hastings or any other locality, where he proposed to gain a livelihood by cultivating the soil, would be the character of the products grown, and the cost of their cultivation.

As Irish potatoes is the main money crop grown here, although many other upon her by the French Government.
